Declaration of John P. Connolly, Ph.D., P.E., B.C.E.E.

I, John P. Connolly, state the following:

- 1. My name is John P. Connolly, and I am a Principal/Senior Technical Advisor for Anchor QEA, located in Montvale, NJ. Anchor QEA was compensated at a rate of \$348 per hour for the time I devoted to this project.
- 2. I hold a B.E. degree in Civil Engineering from Manhattan College, a M.E. in Environmental Engineering from Manhattan College, and a Ph.D. in Environmental Health Engineering from The University of Texas at Austin. I am a registered professional engineer in New York and Texas, a Diplomate by Eminence in the American Academy of Environmental Engineers and a member of the United States Environmental Protection Agency (USEPA) Science Advisory Board.
- 3. I have studied environmental chemistry as part of my graduate work and I taught chemical equilibrium modeling as a professor at Manhattan College. I have developed models of phosphorus cycling in lakes and have been involved in a phosphorus TMDL study in the Androscoggin River in Maine. I have worked on hazardous waste problems since the late 1970s when I did my Ph.D. research on the pesticide Kepone. Included in my experience is work on most of the high profile CERCLA sites in the United States and I have testified before Congress and the New York State Assembly on hazardous wastes in river, estuary and lake sediments.
- 4. I have been asked in this declaration to explain principles of basic chemistry, as they relate to the above-titled litigation. The contents of this declaration are facts, not opinions. The sources for each factual statement, many of which consist of introductory-level chemistry textbooks, are attached as exhibits to this declaration and are referenced herein by author.

- 5. "Matter is anything that takes up space and has mass" (Enger and Smith (2002) at 69). Matter can be classified into two categories: pure substances and mixtures (Whitten et al. (2000) at 12).
- 6. A pure substance is a kind of matter that has a fixed composition and properties that do not vary (Whitten et al. (2000) at 12). "Each substance has its own characteristic set of properties that are different from the set of properties of any other substance" (Whitten et al. (2000) at 13). Pure substances exist in two forms: elements and compounds (Whitten et al. (2000) at 12).
- 7. An element is a form of matter consisting of a specific kind of atom that cannot be decomposed into simpler substances by chemical changes (Enger and Smith (2002) at 466; Whitten et al. (2000) at 12). "The smallest particle of an element that maintains its chemical identity through all chemical and physical changes is called an atom" (Whitten et al. (2000) at 48). "[T]he smallest particle of an element or compound that that can have a stable independent existence" is a molecule (Whitten et al. (2000) at 49). "In nearly all molecules, two or more atoms are bonded together in very small, discrete units (particles) that are electrically neutral. ... The oxygen with which we are all familiar is made up of two atoms of oxygen; it is a diatomic molecule, O₂. ... Some other elements exist as more complex molecules. One form of phosphorus molecules consists of four atoms, and sulfur exists as eight-atom molecules at ordinary temperatures and pressures. Molecules that contain two or more atoms are called polyatomic molecules." (Whitten et al. (2000) at 49.)
- 8. "A compound is a pure substance consisting of two or more different elements in a fixed ratio" (Whitten et al. (2000) at 15). Compounds "can be decomposed by chemical means into simpler substances" (Whitten et al. (2000) at 14) (*i.e.* elements or other compounds), but cannot be broken down or purified by physical means (Whitten et al. (2000) at 13). "The physical and chemical properties of a compound are different from the properties of its constituent elements" (Whitten et al. (2000) at 15). For example, "[s]odium chloride is a white solid that we ordinarily use as table salt. This compound is formed by the combination of the element sodium (a soft, silvery white metal that reacts violently with water) and the element chlorine (a pale green, corrosive, poisonous gas)." (Whitten et al. (2000) at 15.)
- 9. A mixture is a "combination[] of two or more pure substances in which each substance retains its own composition and properties" (Whitten et al. (2000) at 10). "Mixtures can be separated by physical means because each component retains its properties. For example, a mixture of salt and water can be separated by evaporating the water and leaving the solid salt behind." (Whitten et al. (2000) at 12.)
- 10. Phosphorus is element 15 in the periodic chart and designated by the symbol, P (Whitten et al. (2000) at 126). Phosphorus is a nonmetal and readily forms bonds with metals and nonmetals (Whitten et al. (2000) at 957). The element phosphorus is not stable at room temperature and atmospheric pressure as a single atom. Instead, phosphorus exists only as diatomic or polyatomic molecules of more than one P atom (P₂, P₄, P₈, etc.), and is referred to as "elemental phosphorus" (Zuckerman and Hagen (1988) at 18; Whitten et al.

- (2000) at 49). In this respect, phosphorus is similar to oxygen and nitrogen, which only exist in nature as diatomic or polyatomic molecules in their elemental state (Whitten et al. (2000) at 49).
- 11. Elemental phosphorus exists (either in nature or by synthetic production) in "four or more solid allotropic¹ forms: white (or yellow), 2 red, and black (or violet)" (CRC Handbook (1985) at B-28). The difference between each of these forms stems from their distinct number of phosphorus atoms and molecular structure (Zuckerman and Hagen (1988) at 18). For example, white phosphorus is a polyatomic molecule (P₄) and "is the least stable and most reactive of the phosphorus allotropes" (Zuckerman and Hagen (1988) at 18).
- 12. The element phosphorus "is always combined in nature," as a phosphorus compound or elemental phosphorus (Whitten et al. (2000) at 964). "Phosphorus is present in all living organisms" (Whitten et al. (2000) at 964), as well as thousands of human food products including butter, cheese, eggs and milk (USDA National Nutrient Database at Release 21). A wide variety of phosphorus compounds, such as orthophosphates and polyphosphates, are also commonly "encountered in environmental engineering practice" (Sawyer et al. (1994) at 598). "The largest use of phosphorus is in fertilizers. Phosphorus is an essential nutrient, and nature's phosphorus cycle is very slow owing to the low solubility of most natural phosphates. Phosphate fertilizers are therefore essential." (Whitten et al. (2000) at 965.)
- 13. Orthophosphates consist of a phosphorus atom bonded to four oxygen atoms (PO₄) (Chapra (1997) at 523). The release of the phosphorus atom from the bonded oxygen atoms would require chemical means (Whitten et al. (2000) at 13).
- 14. The following chart identifies compounds listed in 40 C.F.R. § 302.4 that include phosphorus as a constituent element.

| Hazardous Substance | CASRN | Originating Authority ³ |
|---------------------------------|------------|---|
| Aluminum phosphide | 20859-73-8 | 42 U.S.C. § 6921 (RCRA) |
| Coumaphos | 56-72-4 | 33 U.S.C. § 1321(b)(2)(A) (Clean Water Act) |
| Cyclophosphamide | 50-18-0 | 42 U.S.C. § 6921 (RCRA) |
| Dichlorvos | 62-73-7 | 42 U.S.C. § 7412(b)(1) (Clean Air Act) |
| | | 33 U.S.C. § 1321(b)(2)(A) (Clean Water Act) |
| O,O-Diethyl S-methyl | 3288-58-2 | 42 U.S.C. § 6921 (RCRA) |
| dithiophosphate | | |
| Diethyl-p-nitrophenyl phosphate | 311-45-5 | 42 U.S.C. § 6921 (RCRA) |

¹ Allotropes are different forms of the same element in the same physical state (Whitten et al. (2000) at 51).

² White phosphorus has two modifications (CRC Handbook (1984) at B-28).

³ The originating authority for each substance is coded on Table 302.4 under "Statutory Code." Each originating authority is defined and designated a number between 1 and 4, as explained in the note under 40 C.F.R. § 302.4(b).

| Hazardous Substance | CASRN | Originating Authority ³ |

5

⁵ The Clean Air Act listing of hazardous substances includes the following note at 42 U.S.C. § 7412(b)(1): "For all listings above which contain the word 'compounds' and for glycol ethers, the following applies: Unless otherwise specified, these listings are defined as including any unique chemical substances that contains the named chemical (i.e., antimony, arsenic, etc.) as part of that chemical's infrastructure."

I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct.

but it cannot be proved true in every case because it is impossible to test every case. It is important to recognize that the word theory is often used in a much less restrictive sense. Often it is used incorrectly to describe a vague idea or a hunch. This is not a theory in the scientific sense. So when you see or hear the word theory you must look at the context to see if the speaker or writer is referring to a theory in the scientific sense.

Now that we have some idea of how the scientific method works, let's look at an example. In many rivers in industrial parts of the world, it is possible to notice tumors of the skin and liver in the fish that live in the rivers (observation). This raises the question of what causes the tumors. Many people feel that the tumors are caused by the toxic chemicals that have been released into the rivers by industrial plants (hypothesis). Now, how could an experiment be conducted to test the hypothesis? If an industrial plant is suspected of releasing toxic chemicals that cause tumors, resident species of fish that do not migrate can be collected upstream and downstream from the plant's wastewater discharge pipes (outfall). Fish collected above the outfall constitute the control group, and those collected below the outfall constitute the experimental group. Large numbers of ish would have to be collected and exmined. If the fish below the outfall have ignificantly more tumors than those bove the outfall, it is because of where hey live in the river and so the toxic hemicals from the industrial plants are a robable cause of the tumors. This is articularly true if the chemicals are alady known to cause tumors. After the ta were evaluated, the results of the periment would be published. Cernly, the owners of the industrial plants ould want to look at the data and might int to repeat the experiment to see if y get the same results.

ulations of Science

powerful tool for developdi understanding of the natural d, but it cannot analyze internal politics, decide if family-planning programs should be instituted, or evaluate the significance of a beautiful landscape. These tasks are beyond the scope of scientific investigation. This does not mean that scientists cannot comment on such issues. They often do. But they should not be regarded as more knowledgeable on these issues just because they are scientists. Scientists may know more about the scientific aspects of these issues, but they struggle with the same moral and ethical questions that face all people, and their judgments on these matters can be just as faulty as anyone else's.

It is important to differentiate between the scientific data collected and the opinions scientists have about what the data mean. Scientists form and state opinions that may not always be supported by fact, just as other people do. Equally reputable scientists commonly state opinions that are in direct contradiction. This is especially true in environmental science, where predictions about the future must be based on inadequate or fragmentary data. The issue of climate change (covered in chapter 18) is an example of this.

It is important to recognize that some scientific knowledge can be used to support both valid and invalid conclusions. For example, the following statements are all factual.

- Many of the kinds of chemicals used in modern agriculture are toxic to humans and other animals.
- Agricultural chemicals have been detected in small amounts in some agricultural products.
- Low levels of some toxic materials have been strongly linked to a variety of human illnesses.

This does not mean that all foods grown with the use of chemicals are less nutritious or are dangerous to health or that "organically grown" foods are necessarily more nutritious or more healthful because they have been grown without agricultural chemicals. The idea that something that is artificial is necessarily bad and something natural is necessarily good is an oversimplification. After all, many plants such as tobacco, poison ivy,

and rhubarb leaves naturally contain toxic materials, while the use of chemical fertilizers has contributed to the health of major portions of the world since their use accounts for about one-third of the food grown in the world. However, it is appropriate to question if the use of agricultural chemicals is always necessary or if trace amounts of specific agricultural chemicals in food are dangerous. It is often easy to jump to conclusions or confuse fact with hypothesis, particularly when we generalize.

HierStructure of

Now that we have an appreciation for the methods of science, it is time to explore some basic information and theories about the structure and function of various kinds of matter. Matter is anything that takes up space and has mass. Air, water, trees, cement, and gold are all examples of matter. A central theory that describes the structure and activity of matter is the kinetic molecular theory. This theory states that all matter is made up of tiny objects that are in constant motion. Although different kind of matter have different properties, they are similar in one fundamental way They are all made up of one or more kinds of smaller subunits called atoms.

Atomic Structure

Atoms are the fundamental subunits of matter. They in turn are made up of protons, neutrons, and electrons. There are 92 kinds of atoms found in nature. Each kind forms a specific type of matter known as an element. Gold (Au), oxygen (O), and mercury (Hg) are examples of elements. All atoms are composed of a central region known as a nucleus, which is composed of two kinds of relatively heavy particles: positively charged particles called protons and uncharged particles called neutrons. Surrounding the nucleus are clouds of relatively lightweight, fast-moving, negatively charged particles called electrons. As mentioned earlier, each kind of element is

b 2 foborer

- supported in an area over an extended period of time.
- catalyst A substance that alters the rate of a reaction but is not itself changed.
- chemical bond The physical attraction between atoms that results from the interaction of their electrons.
- chemical weathering Processes that involve the chemical alteration of rock in such a manner that it is more likely to fragment or to be dissolved.
- chlorinated hydrocarbon A class of pesticide consisting of carbon, hydrogen, and chlorine, which are very stable.
- chlorofluorocarbons (CFC) Stable compounds containing carbon, hydrogen, chlorine and fluorine. They were formerly used as refrigerants, propellants in aerosol containers, and expanders in foam products. They are linked to the depletion of the ozone layer.
- chronic toxicity A serious effect, such as an illness or death, that occurs after prolonged exposure to small doses of a toxic substance.
- clear-cutting A forest harvesting method in which all the trees in a large area are cut and removed.
- climax community Last stage of succession; a relatively stable, long-lasting, complex, and interrelated community of plants, animals, fungi, and bacteria.
- **coevolution** Two or more species of organisms reciprocally influencing the evolutionary direction of the other.
- **combustion** The process of releasing chemical bond energy from fuel.
- **commensalism** The relationship between organisms in which one organism benefits while the other is not affected.
- **community** Interacting groups of different species.
- competition An interaction between two organisms in which both require the same limited resource, which results in harm to both.
- composting A waste disposal system whereby organic matter is allowed to decay to a usable product.
- compound A kind of matter composed of two or more different kinds of atoms bonded together.
- Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) The 1980 U.S. law that addressed the issue of cleanup of hazardous-waste sites.
- **confined aquifier** An aquifier that is bounded on the top and bottom by impermeable confining layers.
- conservation To use in the best possible way so that the greatest long-term benefit is realized by society.

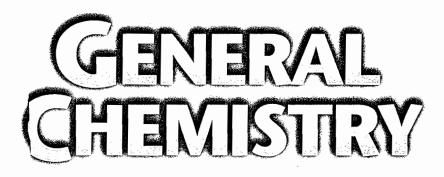

- conservation ethic An environmental ethic that stresses a balance between total development and absolute preservation.
- consumers Organisms that use other organisms as food.
- **contour farming** A method of tilling and planting at right angles to the slope, which reduces soil erosion by runoff.
- controlled experiment An experiment in which two groups are compared. One, the control, is used as a basis of comparison and the other, the experimental, has one factor different from the control.
- **coral reef ecosystem** A tropical, shallowwater, marine ecosystem dominated by coral organisms that produce external skeletons.
- corporation A business structure that has a particular legal status.
- **corrosiveness** Ability of a chemical to degrade standard materials.
- cost-benefit analysis A method used to determine the feasibility of pursuing a particular project by balancing estimated costs against expected benefits.
- cover A term used to refer to any set of physical features that conceals or protects animals from the elements or their enemies.
- **crust** The thin, outer, solid surface of the Earth.

- death phase The portion of the population growth curve of some organisms that shows the population declining.
- death rate The number of deaths per thousand individuals in the population per year.
- **decommissioning** Decontaminating and disassembling a nuclear power plant and safely disposing of the radioactive materials.
- **decomposers** Small organisms, like bacteria and fungi, that cause the decay of dead organic matter and recycle nutrients.
- **demand** Amount of a product that consumers are willing and able to buy at various prices.
- demographic transition The hypothesis that economies proceed through a series of stages, beginning with growing populations high birth and death rates and low economic development and ending with stable populations with low birth and death rates and high economic development.
- **demography** The study of human populations, their characteristics, and their changes.
- **denitrifying bacteria** Bacteria that convert nitrogen compounds into nitrogen gas.

- **density-dependent limiting factors** Those limiting factors that become more severe as the size of the population increases.
- **density-independent limiting factors**Those limiting factors that are not affected by population size.
- **desert** A biome that receives less than 25 centimeters (10 inches) of precipitation per year.
- **desertification** The conversion of arid and semiarid lands into deserts by inappropriate farming practices or overgrazing.
- detritus Tiny particles of organic material that result from fecal waste material or the decomposition of plants and animals.
- development ethic Philosophy that states that the human race should be the master of nature and that the Earth and its resources exist for human benefit and pleasure.
- **dispersal** Migration of organisms from a concentrated population into areas with lower population densities.
- domestic water Water used for domestic activities, such as drinking, air conditioning, bathing, washing clothes, washing dishes, flushing toilets, and watering lawns and gardens.
- ecocentrism An approach to environmental responsibility that maintains that the environment deserves direct moral consideration rather than consideration derived merely from human interests.

- **ecology** A branch of science that deals with the interrelationship between organisms and their environment.
- economic costs Those monetary costs that are necessary to exploit a natural resource.
- **economic growth** The perceived increase in monetary growth within a society.
- **ecosystem** A group of interacting species along with their physical environment.
- **ectoparasite** A parasite that is adapted to live on the outside of its host.
- electron The lightweight, negatively charged particle that moves around at some distance from the nucleus of an atom.
- **element** A form of matter consisting of a specific kind of atom.
- emergent plants Aquatic vegetation that is rooted on the bottom but has leaves that float on the surface or protrude above the water.
- **emigration** Movement out of an area that was once one's place of residence.
- endangered species Those species that are present in such small numbers that they are in immediate jeopardy of becoming extinct.

CHAPTER 1: The Foundations of Chemistry

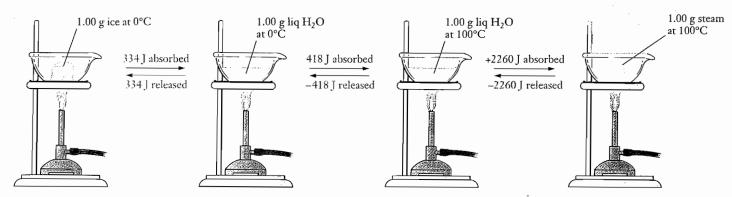

Figure 1-5 Changes in energy that accompany some physical changes for water. The energy unit joules (J) is defined in Section 1-13.

water to form ice. The changes in energy that accompany these physical changes for water are shown in Figure 1-5. At a pressure of one atmosphere, ice always melts at the same temperature (0°C), and pure water always boils at the same temperature (100°C).

1-5 MIXTURES, SUBSTANCES, COMPOUNDS, AND ELEMENTS

Mixtures are combinations of two or more pure substances in which each substance retains its own composition and properties. Almost every sample of matter that we ordinarily encounter is a mixture. The most easily recognized type of mixture is one in which different portions of the sample have recognizably different properties. Such a mixture, which is not uniform throughout, is called heterogeneous. Examples include mixtures of salt and charcoal (in which two components with different colors can be distinguished readily from each other by sight), foggy air (which includes a suspended mist of water droplets), and vegetable soup. Another kind of mixture has uniform properties throughout; such a mixture is described as a homogeneous mixture and is also called a solution. Examples include salt water; some alloys, which are homogeneous mixtures of metals in the solid state; and air (free of particulate matter or mists). Air is a mixture of gases. It is mainly nitrogen, oxygen, argon, carbon dioxide, and water vapor. There are only trace amounts of other substances in the atmosphere.

An important characteristic of all mixtures is that they can have variable composition. (For instance, we can make an infinite number of different mixtures of salt and sugar by varying the relative amounts of the two components used.) Consequently, repeating the same experiment on mixtures from different sources may give different results, whereas the same treatment of a pure sample will always give the same results. When the distinction between homogeneous mixtures and pure substances was realized and methods were developed (in the late 1700s) for separating mixtures and studying pure substances, consistent results could be obtained. This resulted in reproducible chemical properties, which formed the basis of real progress in the development of chemical theory.

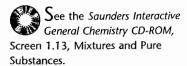

By "composition of a mixture," we mean both the identities of the substances present and their relative amounts in the mixture.

The blue copper(II) sulfate solution in Figure 1-4c is a homogeneous mixture.

A heterogeneous mixture of two minerals: galena (black) and quartz (white).

CHAPTER 1: The Foundations of Chemistry

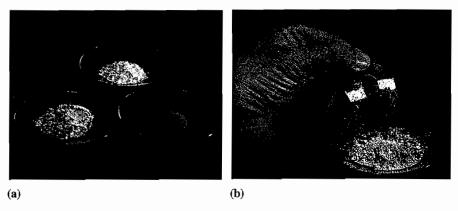

Figure 1-6 (a) A mixture of iron and sulfur is a heterogeneous mixture. (b) Like any mixtur it can be separated by physical means, such as removing the iron with a magnet.

See the Saunders Interactive General Chemistry CD-ROM, n 1.14, Separation of Mixtures.

Mixtures can be separated by physical means because each component retains its projecties (Figures 1-6 and 1-7). For example, a mixture of salt and water can be separated levaporating the water and leaving the solid salt behind. To separate a mixture of sand ar salt, we could treat it with water to dissolve the salt, collect the sand by filtration, ar then evaporate the water to reclaim the solid salt. Very fine iron powder can be mixed with powdered sulfur to give what appears to the naked eye to be a homogeneous mixture of the two. Separation of the components of this mixture is easy, however. The iron may be removed by a magnet, or the sulfur may be dissolved in carbon disulfide, while does not dissolve iron (Figure 1-6).

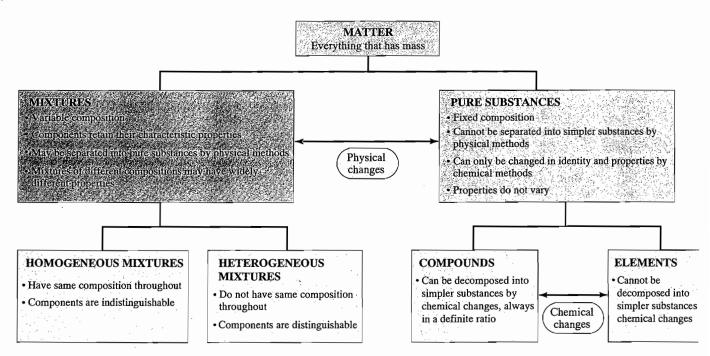

Figure 1-7 One scheme for classification of matter. Arrows indicate the general means b which matter can be separated.

In any mixture, (1) the composition can be varied and (2) each component of the mixture retains its own properties.

Imagine that we have a sample of muddy river water (a heterogeneous mixture). We might first separate the suspended dirt from the liquid by filtration. Then we could remove dissolved air by warming the water. Dissolved solids might be removed by cooling the sample until some of it freezes, pouring off the liquid, and then melting the ice. Other dissolved components might be separated by distillation or other methods. Eventually we would obtain a sample of pure water that could not be further separated by any physical separation methods. No matter what the original source of the impure water—the ocean, the Mississippi River, a can of tomato juice, and so on-water samples obtained by purification all have identical composition, and, under identical conditions, they all have identical properties. Any such sample is called a substance, or sometimes a pure substance.

The first ice that forms is quite pure. The dissolved solids tend to stay behind in the remaining liquid.

A substance cannot be further broken down or purified by physical means. A substance is matter of a particular kind. Each substance has its own characteristic properties that are different from the set of properties of any other substance.

If we use the definition gi substance, the phrase pure s appear to be redundant.

Now suppose we decompose some water by passing electricity through it (Figure 1-8). (An electrolysis process is a chemical reaction.) We find that the water is converted into two simpler substances, hydrogen and oxygen; more significantly, hydrogen and

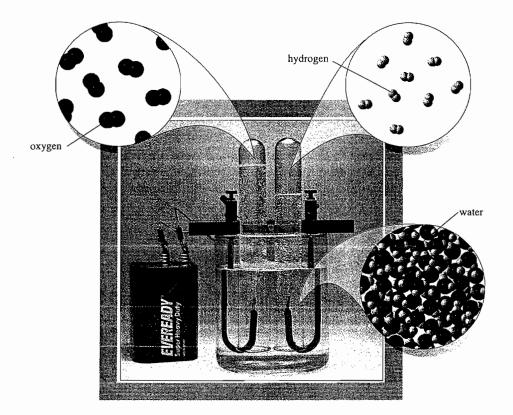

Figure 1-8 Electrolysis apparatus for small-scale chemical decomposition of water by electrical energy. The volume of hydrogen produced (right) is twice that of oxygen (left). Some dilute sulfuric acid is added to increase the conductivity.

ise 4:05-cv-00329-GKF-PJC

CHAPTER 1: The Foundations of Chemistry

oxygen are always present in the same ratio by mass, 11.1% to 88.9%. These observations allow us to identify water as a compound.

A **compound** is a substance that can be decomposed by chemical means into simpler substances, always in the same ratio by mass.

As we continue this process, starting with any substance, we eventually reach a stage at which the new substances formed cannot be further broken down by chemical means. The substances at the end of this chain are called elements.

An **element** is a substance that cannot be decomposed into simpler substances by chemical changes.

For instance, neither of the two gases obtained by the electrolysis of water—hydrogen and oxygen—can be further decomposed, so we know that they are elements.

As another illustration (Figure 1-9), pure calcium carbonate (a white solid present in limestone and seashells) can be broken down by heating to give another white solid (call it A) and a gas (call it B) in the mass ratio 56.0:44.0. This observation tells us that calcium carbonate is a compound. The white solid A obtained from calcium carbonate can be further broken down into a solid and a gas in a definite ratio by mass, 71.5:28.5. But neither of these can be further decomposed, so they must be elements. The gas is identical to the oxygen obtained from the electrolysis of water; the solid is a metallic element called calcium. Similarly, the gas B, originally obtained from calcium carbonate, can be decomposed into two elements, carbon and oxygen, in a fixed mass ratio, 27.3:72.7. This sequence illustrates that a compound can be broken apart into simpler substances at a fixed mass ratio; those simpler substances may be either elements or simpler compounds.

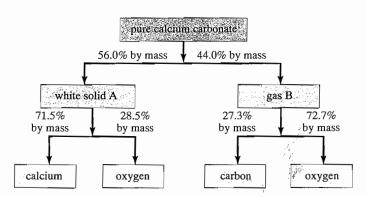

Figure 1-9 Diagram of the decomposition of calcium carbonate to give a white solid A (56.0% by mass) and a gas B (44.0% by mass). This decomposition into simpler substances at a fixed ratio proves that calcium carbonate is a compound. The white solid A further decomposes to give the elements calcium (71.5% by mass) and oxygen (28.5% by mass). This proves that the white solid A is a compound; it is known as calcium oxide. The gas B also can be broken down to give the elements carbon (27.3% by mass) and oxygen (72.7% by mass). This establishes that gas B is a compound; it is known as carbon dioxide.

Page 22 of 69

Furthermore, we may say that a compound is a pure substance consisting of two or more different elements in a fixed ratio. Water is 11.1% hydrogen and 88.9% oxygen by mass. Similarly, carbon dioxide is 27.3% carbon and 72.7% oxygen by mass, and calcium oxide (the white solid A in the previous discussion) is 71.5% calcium and 28.5% oxygen by mass. We could also combine the numbers in the previous paragraph to show that calcium carbonate is 40.1% calcium, 12.0% carbon, and 47.9% oxygen by mass. Observations such as these on innumerable pure compounds led to the statement of the Law of Definite Proportions (also known as the Law of Constant Composition):

Different samples of any pure compound contain the same elements in the same proportions by mass.

The physical and chemical properties of a compound are different from the properties of its constituent elements. Sodium chloride is a white solid that we ordinarily use as table salt (Figure 1-10). This compound is formed by the combination of the element sodium (a soft, silvery white metal that reacts violently with water; see Figure 1-4d) and the element chlorine (a pale green, corrosive, poisonous gas; see Figure 1-2c).

Recall that elements are substances that cannot be decomposed into simpler substances by chemical changes. Nitrogen, silver, aluminum, copper, gold, and sulfur are other examples of elements.

We use a set of **symbols** to represent the elements. These symbols can be written more quickly than names, and they occupy less space. The symbols for the first 109 elements consist of either a capital letter or a capital letter and a lowercase letter, such as C (carbon) or Ca (calcium). A list of the known elements and their symbols is given inside the front cover.

In the past, the discoverers of elements claimed the right to name them (see the essay "The Names of the Elements" on page 68), although the question of who had actually discovered the elements first was sometimes disputed. In modern times, new elements are given temporary names and three-letter symbols based on a numerical system. These designations are used until the question of the right to name the newly discovered elements is resolved. Decisions resolving the names of elements 104 through 109 were announced in 1997 by the International Union of Pure and Applied Chemistry (IUPAC), an international organization that represents chemical societies from 40 countries. IUPAC makes recommendations regarding many matters of convention and terminology in chemistry. These recommendations carry no legal force, but they are normally viewed as authoritative throughout the world.

A short list of symbols of common elements is given in Table 1-2. Learning this list will be helpful. Many symbols consist of the first one or two letters of the element's English name. Some are derived from the element's Latin name (indicated in parentheses in Table 1-2) and one, W for tungsten, is from the German Wolfram. Names and symbols for additional elements should be learned as they are encountered.

Most of the earth's crust is made up of a relatively small number of elements. Only 10 of the 88 naturally occurring elements make up more than 99% by mass of the earth's crust, oceans, and atmosphere (Table 1-3). Oxygen accounts for roughly half. Relatively few elements, approximately one fourth of the naturally occurring ones, occur in nature as free elements. The rest are always found chemically combined with other elements.

A very small amount of the matter in the earth's crust, oceans, and atmosphere is involved in living matter. The main element in living matter is carbon, but only a tiny

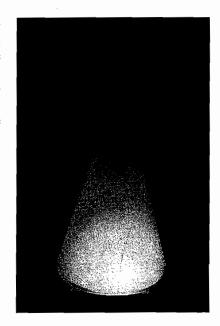

Figure 1-10 The reaction of sodium, a solid element, and chlorine, a gaseous element, to produce sodium chloride (table salt). This reaction gives off considerable energy in the form of heat and light.

The other known elements have been made artificially in laboratories, as described in Chapter 26.

48

The term "atom" comes from the Greek language and means "not divided" or "indivisible."

The radius of a calcium atom is only 1.97×10^{-8} cm, and its mass is 6.66×10^{-23} g.

Statement 3 is true for *chemical* reactions. It is not true, however, for *nuclear* reactions (Chapter 26).

2-1 ATOMS AND MOLECULES

The Greek philosopher Democritus (470–400 BC) suggested that all matter is composed of tiny, discrete, indivisible particles that he called atoms. His ideas, based entirely on philosophical speculation rather than experimental evidence, were rejected for 2000 years. By the late 1700s, scientists began to realize that the concept of atoms provided an explanation for many experimental observations about the nature of matter.

By the early 1800s, the Law of Conservation of Matter (Section 1-1) and the Law of Definite Proportions (Section 1-5) were both accepted as general descriptions of how matter behaves. John Dalton (1766–1844), an English schoolteacher, tried to explain why matter behaves in such systematic ways as those expressed here. In 1808, he published the first "modern" ideas about the existence and nature of atoms. Dalton's explanation summarized and expanded the nebulous concepts of early philosophers and scientists; more importantly, his ideas were based on *reproducible experimental results* of measurements by many scientists. These ideas form the core of **Dalton's Atomic Theory**, one of the highlights in the history of scientific thought. In condensed form, Dalton's ideas may be stated as follows:

- 1. An element is composed of extremely small, indivisible particles called atoms.
- 2. All atoms of a given element have identical properties that differ from those of other elements.
- Atoms cannot be created, destroyed, or transformed into atoms of another element.
- **4.** Compounds are formed when atoms of different elements combine with one another in small whole-number ratios.
- 5. The relative numbers and kinds of atoms are constant in a given compound.

Dalton believed that atoms were solid, indivisible spheres, an idea we now reject. But he showed remarkable insight into the nature of matter and its interactions. Some of his ideas could not be verified (or refuted) experimentally at the time. They were based on the limited experimental observations of his day. Even with their shortcomings, Dalton's ideas provided a framework that could be modified and expanded by later scientists. Thus John Dalton is often considered to be the father of modern atomic theory.

The smallest particle of an element that maintains its chemical identity through all chemical and physical changes is called an **atom** (Figure 2-1). In Chapter 5, we shall study the structure of the atom in detail; let us simply summarize here the main features of atomic composition. Atoms, and therefore *all* matter, consist principally of three **fundamental particles**: *electrons*, *protons*, and *neutrons*. These are the basic building blocks of

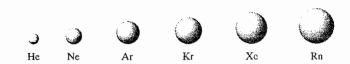

Figure 2-1 Relative sizes of monatomic molecules (single atoms) of the noble gases.

| | undamental Particles | |
|-------------------------------|----------------------------|----------------------------|
| Particle (symbol) | Approximate Mass (amu)* | Charge (relative scale) |
| electron (e ⁻) | 0.0 | 1- |
| proton $(p \text{ or } p^+)$ | 1.0 | 1+ |
| neutron $(n \text{ or } n^0)$ | 1.0 | none |

^{*1} $amu = 1.6605 \times 10^{-24} g$

atoms. The masses and charges of the three fundamental particles are shown in Table 2-1. The masses of protons and neutrons are nearly equal, but the mass of an electron is much smaller. Neutrons carry no charge. The charge on a proton is equal in magnitude, but opposite in sign, to the charge on an electron. Because atoms are electrically neutral,

an atom contains equal numbers of electrons and protons.

The **atomic number** (symbol is **Z**) of an element is defined as the number of protons in the nucleus. In the periodic table, elements are arranged in order of increasing atomic numbers. These are the red numbers above the symbols for the elements in the periodic table on the inside front cover. For example, the atomic number of silver is 47.

A molecule is the smallest particle of an element or compound that can have a stable independent existence. In nearly all molecules, two or more atoms are bonded together in very small, discrete units (particles) that are electrically neutral.

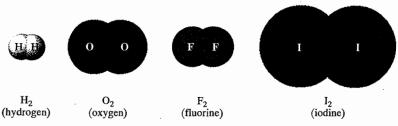

Individual oxygen atoms are not stable at room temperature and atmospheric pressure. Single atoms of oxygen mixed under these conditions quickly combine to form pairs. The oxygen with which we are all familiar is made up of two atoms of oxygen; it is a *diatomic* molecule, O₂. Hydrogen, nitrogen, fluorine, chlorine, bromine, and iodine are other examples of diatomic molecules (Figure 2-2).

Some other elements exist as more complex molecules. One form of phosphorus molecules consists of four atoms, and sulfur exists as eight-atom molecules at ordinary temperatures and pressures. Molecules that contain two or more atoms are called *polyatomic* molecules (Figure 2-3).

For Group VIIIA elements, the gases, a molecule contains only atom, and so an atom and a more the same (see Figure 2-1).

You should remember the com elements that occur as diatomimolecules: H₂, N₂, O₂, F₂, Cl₂

Models of diatomic molecules of some elements, approximately to scale.

Sulfate ion, SO₄²⁻

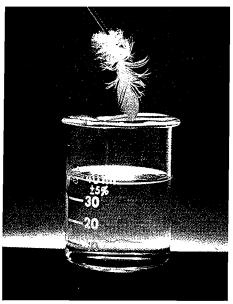

NITROGEN AND PHOSPHORUS

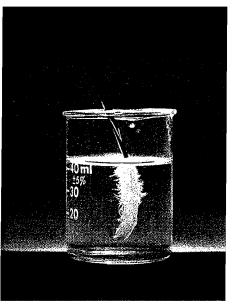

The Group VA elements provide a dramatic illustration of the vertical trends in metallic properties. In this family, nitrogen and phosphorus are nonmetals, arsenic is predominantly nonmetallic, antimony is more metallic, and bismuth is definitely metallic. Properties of the Group VA elements are listed in Table 24-7.

Oxidation states of the VA elements range from -3 to +5. Odd-numbered oxidation ates are favored. The VA elements form very few monatomic ions. Ions with a charge f3 occur for N and P, as in Mg_3N_2 and Ca_3P_2 .

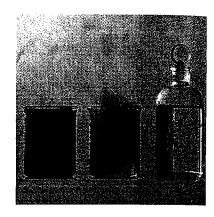

All of the Group VA elements show the -3 oxidation state in covalent compounds such NH₃ and PH₃. The +5 oxidation state is found only in covalent compounds such as iosphorus pentafluoride, PF₅; nitric acid, HNO₃; and phosphoric acid, H₃PO₄; and in ilyatomic ions such as NO₃⁻ and PO₄³⁻. Each Group VA element exhibits the +3 oxidans state in one of its oxides, for instance, N₂O₃ and P₄O₆. These are acid anhydrides of rous acid, HNO₂, and phosphorous acid, H₃PO₃; both are weak acids. No other element nibits more oxidation states than nitrogen (Table 24-8).

Nitric acid, HNO₃, reacts with protein-containing materials such as this feather, staining them yellow. Perhaps you have spilled nitric acid on your skin and seen it turn yellow.

Copper (*left beaker*) and zinc (*right beaker*) react with concentrated nitric acid.

White phosphorus reacts with air, so it is stored under water. It contains tetrahedral P₄ molecules.

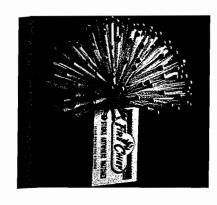

NaNO2 and NaNO3 as Food Additives

The brown color of "old" meat is the result of oxidation of blood and is objectionable to many consumers. Nitrites and nitrates are added to food to retard this oxidation and also to prevent growth of botulism bacteria. Nitrate ions, NO₃⁻, are reduced to NO₂⁻ ions, which are then converted to NO. This in turn reacts with the brown oxidized form of the heme in blood. This reaction keeps meat red longer. Controversy has arisen, however, concerning the possibility that nitrites combine with amines under the acidic conditions in the stomach to produce carcinogenic *nitrosoamines*.

24-17 PHOSPHORUS

Phosphorus is always combined in nature. Phosphorus is present in all living organisms—as organophosphates and in calcium phosphates such as hydroxyapatite, $Ca_5(PO_4)_3(OH)$, and fluorapatite, $Ca_5(PO_4)_3F$, in bones and teeth. It also occurs in these and related compounds in phosphate minerals, which are mined mostly in Florida and North Africa.

Industrially, the element is obtained from phosphate minerals by heating them at 1200 to 1500°C in an electric arc furnace with sand (SiO₂) and coke.

The tips of "strike anywhere" matches contain tetraphosphorus trisulfide and red phosphorus. Friction converts kinetic energy into heat, which initiates a spontaneous reaction.

$$P_4S_3(s) + 8O_2(g) \longrightarrow P_4O_{10}(s) + 3SO_2(g)$$

Vaporized phosphorus is condensed to a white solid (mp = 44.2° C, bp = 280.3° C) under H_2O to prevent oxidation. Even when kept under H_2O , white phosphorus slowly converts to the more stable red phosphorus allotrope (mp = 597° C; sublimes at 431° C). Red phosphorus and tetraphosphorus trisulfide, P_4S_3 , are used in matches. They do not burn spontaneously, yet they ignite easily when heated by friction. Both white and red phosphorus are insoluble in water.

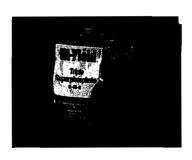

The largest use of phosphorus is in fertilizers. Phosphorus is an essential nutrient, and nature's phosphorus cycle is very slow owing to the low solubility of most natural phosphates. Phosphate fertilizers are therefore essential. To increase the solubility of the natural phosphates, they are treated with $\rm H_2SO_4$ to produce "superphosphate of lime," a mixture of two salts. This solid is pulverized and applied as a powder.

$$\begin{array}{c} \text{Ca}_3(\text{PO}_4)_2 + 2\text{H}_2\text{SO}_4 + 4\text{H}_2\text{O} \xrightarrow{\text{evaporate}} & [\text{Ca}(\text{H}_2\text{PO}_4)_2 + 2(\text{CaSO}_4 \cdot 2\text{H}_2\text{O})] \\ \text{calcium} & \text{calcium} \\ \text{dihydrogen} & \text{sulfate} \\ \text{phosphate} & \text{dihydrate} \\ \\ \text{superphosphate of lime} \\ \end{array}$$

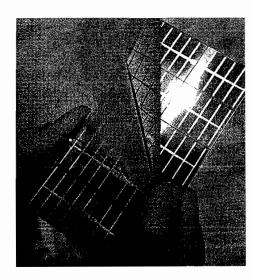

This reaction represents the most popular use of sulfuric acid, the industrial chemical produced in largest quantity.

SILICON

Silicon is a shiny, blue-gray, high-melting, brittle metalloid. It looks like a metal, but it is chemically more like a nonmetal. It is second only to oxygen in abundance in the earth's crust, about 87% of which is composed of silica (SiO₂) and its derivatives, the silicate minerals. The crust is 26% Si, compared with 49.5% O. Silicon does not occur free in nature. Pure silicon crystallizes with a diamond-type structure, but the Si atoms are less closely packed than C atoms. Its density is 2.4 g/cm³ compared with 3.51 g/cm³ for diamond.

Superphosphate fertilizer.

Pure silicon is used in solar cells to collect energy from the sun.

4.2. Homoatomic Bonds

4.2.2. Catenated Group VB Atoms

4.2.2.2. Involving Phosphorus-Phosphorus Bonds

4.2.2.2.2. In Phosphorus Allotropes.

The literature of phosphorus allotropy is complex and confusing and contains claims of the existence of forms of solid phosphorus that are invalid. However, at least three species of elemental phosphorus should be noted:

- (i) White Phosphorus¹. These molecular crystals contain arrays of P₄ molecules as noted in §4.2.2.2.1. It is the least stable and most reactive of the phosphorus allotropes.
- (ii) Violet (or Red) Phosphorus. White phosphorus can be converted to the more stable, crystalline violet (or red) phosphorus, which has a double-layer structure² consisting of cagelike P₈ and P₉ groups that are linked alternately by pairs of phosphorus atoms to form tubes having pentagonal cross sections. The double layers are formed from parallel tubes in which the tubes in adjacent layers are approximately perpendicular to each other. Each double layer of tubes consists of two interpenetrating systems of tubes that are not bonded chemically to each other. Further, there are no chemical bonds between adjacent double layers.
- (iii) Black Phosphorus. When white phosphorus is subjected to a pressure of 12,000 kg cm⁻² (1200 MPa) at 200°C, it is converted to black phosphorus, which is the most stable of the phosphorus allotropes³. Black phosphorus has a graphite-like appearance and, like graphite, it is an electrical conductor. It is made up of puckered layers of phosphorus atoms, each of which is covalently bound with three other phosphorus atoms. The P—P bond lengths average 2.234 Å (223.4 pm) and the bond angles are 102° and 96° in a ratio of 2:1.

Vapor from red phosphorus, and presumably from white phosphorus at sufficiently high T, consists of P_2 molecules with a $P \equiv P$ bond distance⁴ of 1.895 Å (189.5 pm).

4.2.2.2.3. in Linear and Cyclic Di- and Polyphosphines.

Diphosphines and polyphosphines, both linear and cyclic, are prepared by coupling reactions, e.g., dehydrohalogenation between a primary or secondary phosphine and a mono- or dihalophosphine, as in the synthesis¹ of (PhP)₅ or (PhP)₆ from PhPH₂ with PhPCl₂. The compound Me₂PPMe₂ is formed by^{2,3}:

$$(CH_3)_2PCl + 2 (CH_3)_2PH \rightarrow (CH_3)_2PP(CH_3)_2 + [(CH_3)_2PH_2]Cl$$
 (a)

Tetracyclohexyltetracyclophosphine is obtained in refluxing toluene4:

2 cyclo-
$$C_6H_{11}PH_2 + 2$$
 cyclo- $C_6H_{11}PCl_2 \rightarrow [cyclo-C_6H_{11}P]_4 + 4$ HCl (b)

The tetraethyl compound is prepared by the same method⁵, which is also used to synthesize R₂PPR'₂ compounds, where R and R' are alkyl, perfluoroalkyl, aryl or amino groups. The reactions are run at reduced T, and tertiary amines are used to promote the removal of hydrogen halide, e.g.:

 $(CH_3)_2PCl + (CF_3)_2PH + (CH_3)_3N \xrightarrow{-78^{\circ}C} (CH_3)_2PP(CF_3)_2 + [(CH_3)_3NH]Cl (c)^6$ A variation yields pentaphenyltriphosphine:

$$2 (C_6H_5)_2PH + Br_2PC_6H_5 + 2 (C_2H_5)_3N \rightarrow (C_6H_5)_2P - PC_6H_5 - P(C_6H_5)_2 + 2 [(C_2H_3)_3NH]Br$$

THE ELEMENTS (continued)

wt. 106.4; at. no. 46; m.p. 1554°C; b.p. 2970°C; sp. gr. 12.02 (20°C); valence 2, 3, or 4. Discovered in 1803 by Wollaston. Palladium is found along with platinum and other metals of the platinum group in placer deposits of the U.S.S.R., South and North America, Ethiopia, and Australia. It is also found associated with the nickel-copper deposits of South Africa and Ontario. Its separation from the platinum metals depends upon the type of ore in which it is found. It is a steel-white metal, does not tarnish in air, and is the least dense and lowest melting of the platinum group of metals. When annealed, it is soft and ductile; cold working greatly increases its strength and hardness. Palladium is attacked by nitric and sulfuric acid. At room temperatures the metal has the unusual property of absorbing up to 900 times its own volume of hydrogen, possibly forming Pd₂H. It is not yet clear if this is a true compound. Hydrogen readily diffuses through heated palladium and this provides a means of purifying the gas. Finely divided palladium is a good catalyst and is used for hydrogenation and dehydrogenation reactions. It is alloyed and used in jewelry trades. White gold is an alloy of gold decolorized by the addition of palladium. Like gold, palladium can be beaten into leaf as thin as 1/250,000 in. The metal is used in dentistry, watchmaking, and in making surgical instruments and electrical contacts. The metal sells for about \$100/tr. oz.

Phosphorus — (Gr. phosphoros, light bearing; ancient name for the planet Venus when appearing before sunrise), P; at. wt. 30.97376; at. no. 15; m.p. (white) 44.1°C; b.p. (white) 280°C; sp. gr. (white) 1.82, (red) 2.20, (black) 2.25 to 2.69; valence 3 or 5. Discovered in 1669 by Brand, who prepared it from urine. Phosphorus exists in four or more allotropic forms: white (or yellow), red, and black (or violet). White phosphorus has two modifications: α and β with a transition temperature at -3.8°C. Never found free in nature, it is widely distributed in combination with minerals. Phosphate rock, which contains the mineral apatite, an impure tri-calcium phosphate, is an important source of the element. Large deposits are found in the U.S.S.R., in Morocco, and in Florida, Tennessee, Utah, Idaho, and elsewhere. Phosphorus is an essential ingredient of all cell protoplasm, nervous tissue, and bones. Ordinary phosphorus is a waxy white solid; when pure it is colorless and transparent. It is insoluble in water, but soluble in carbon disulfide. It takes fire spontaneously in air, burning to the pentoxide. It is very poisonous, 50mg constituting an approximate fatal dose. Exposure to white phosphorus should not exceed 0.1mg/M³ (8-hr time-weighted average — 40-hr work week). White phosphorus should be kept under water, as it is dangerously reactive in air, and it should be handled with forceps, as contact with the skin may cause severe burns. When exposed to sunlight or when heated in its own vapor to 250°C, it is converted to the red variety, which does not phosphoresce in air as does the white variety. This form does not ignite spontaneously and it is not as dangerous as white phosphorus. It should, however, be handled with care as it does convert to the white form at some temperatures and it emits highly toxic fumes of the oxides of phosphorus when heated. The red modification is fairly stable, sublimes with a vapor pressure of 1 atm at 417°C, and is used in the manufacture of safety matches, pyrotechnics, pesticides, incendiary shells, smoke bombs, tracer bullets, etc. White phosphorus may be made by several methods. By one process, tri-calcium phosphate, the essential ingredient of phosphate rock, is heated in the presence of carbon and silica in an electric furnace or fuel-fired blast furnace. Elementary phosphorus is liberated as vapor and may be collected under water. If desired, the phosphorus vapor and carbon monoxide produced by the reaction can be oxidized at once in the presence of moisture or water to produce phosphoric acid, an important compound in making super-phosphate fertilizers. In recent years, concentrated phosphoric acids, which may contain as much as 70 to 75% P2Os content, have become of great importance to agriculture and farm production. World-wide demand for fertilizers has caused record phosphate production in recent years. Phosphates are used in the production of special glasses, such as those used for sodium lamps. Bone-ash, calcium phosphate, is also used to produce fine chinaware and to produce monocalcium phosphate used in baking powder. Phosphorus is also important in the production of steels, phosphor bronze, and many other products. Trisodium phosphate is important as a cleaning agent, as a water softener, and for preventing boiler scale and corrosion of pipes and boiler tubes. Organic compounds of phosphorus are important.

Platinum — (Sp. platina, silver), Pt; at. wt. 195.08 \pm 3; at. no. 78; m.p. 1772°C; b.p. 3827 \pm 100°C; sp. gr. 21.45 (20°C); valence 1?, 2, 3, or 4. Discovered in South America by Ulloa in 1735 and by Wood in 1741. The metal was used by pre-Columbian Indians. Platinum occurs native, accompanied by small quantities of iridium, osmium, palladium, ruthenium, and rhodium, all belonging to the same group of metals. These are found in the alluvial deposits of the Ural mountains, of Columbia, and of certain western American states. Sperrylite (PtAs2), occurring with the nickel-bearing deposits of Sudbury, Ontario, is the source of a considerable amount of the metal. The large production of nickel offsets there being only one part of the platinum metals in two million parts of ore. Platinum is a beautiful silvery-white metal, when pure, and is malleable and ductile. It has a coefficient of expansion almost equal to that of soda-lime-silica glass, and is therefore used to make sealed electrodes in glass systems. The metal does not oxidize in air at any temperature, but is corroded by halogens, cyanides, sulfur, and caustic alkalis. It is insoluble in hydrochloric and nitric acid, but dissolves when they are mixed as aqua regia, forming chloroplatinic acid (H₂PtCl6), an important compound. The metal is extensively used in jewelry, wire, and vessels for laboratory use, and in many valuable instruments including thermocouple elements. It is also used for electrical contacts, corrosion-resistant apparatus, and in dentistry. Platinum-cobalt alloys have magnetic properties. One such alloy made of 76.7% Pt and 23.3% Co, by weight, is an extremely powerful magnet that offers a B-H (max) almost twice that of Alnico V. Platinum resistance wires are used for constructing high-temperature electric furnaces. The metal is used for coating missile nose cones, jet engine fuel nozzles, etc., which must perform reliably for long periods of time at high temperatures. The metal, like palladium, absorbs large volumes of hydrogen, retaining it at ordinary temperatures but giving it up at red heat. In the finely divided state platinum is an excellent catalyst, having long been used in the contact process for producing sulfuric acid. It is also used as a catalyst in cracking petroleum products. There is also much current interest in the use of platinum as a catalyst in fuel cells and in antipollution devices for automobiles. Platinum anodes are extensively used in cathodic protection systems for large ships and ocean-going vessels, pipelines, steel piers, etc. Fine platinum wire will glow red hot when placed in the vapor of methyl alcohol. It acts here as a catalyst, converting the alcohol to formaldehyde. This phenomenon has been used commercially to produce cigarette lighters and hand warmers. Hydrogen and oxygen explode in the

| Sodium tripolyphosphate | $Na_5P_3O_{10}$ |
| Tetrasodium pyrophosphate | $Na_4P_2O_7$ |

purposes. The total phosphorus content of digested sludges is ordinarily about 1 percent and that of heat-dried activated sludge about 1.5 percent. In the United States, where phosphate fertilizers are relatively abundant and cheap, most sludges are sold on the basis of their nitrogen content, and little or no credit is given for the phosphorus.

Boiler Waters

Phosphate compounds are widely used in steam power plants to control scaling in boilers. If complex phosphates are used, they are rapidly hydrolyzed to orthophosphate at the high temperatures involved. Control of phosphate levels is accomplished through determinations of orthophosphate.

29-2 PHOSPHORUS COMPOUNDS OF IMPORTANCE

Phosphorus compounds of wide variety are encountered in environmental engineering practice. A list of the more important ones is given in Table 29-1.

All the polyphosphates (molecularly dehydrated phosphates) gradually hydrolyze in aqueous solution and revert to the ortho form from which they were derived:

$$Na_4P_2O_7 + H_2O \rightarrow 2Na_2HPO_4$$
 (29-1)

The rate of reversion is a function of temperature and increases rapidly as the temperature approaches the boiling point. The rate is also increased by lowering the pH, and advantage is taken of this fact in the preparation of samples for the determination of complex phosphates. The hydrolysis of complex phosphates is also influenced by bacterial enzymes. The rate of reversion is very slow in pure waters but is more rapid in wastewaters. Experiments have shown that pyrophosphates are hydrolyzed more rapidly than tripolyphosphates in some

PJC

phosphorus, serves to remove phosphorus from the water to the bottom ser For cases where the water in contact with the sediments contains oxygous ediment phosphorus becomes chemically trapped.

Although phosphorus is naturally scarce, many human activities result i phorus discharge to natural waters. Human and animal wastes both contain stial amounts of phosphorus. In the recent past the former has been supplement detergent phosphorus. In addition nonpoint sources from agricultural and urbaboth contribute excess phosphorus. Part of the enhancement of diffuse sour due to fertilizers and other phosphorus-containing chemicals associated with I land use. Moreover, human uses lead to soil erosion, which also enhances phosp transport into waters.

Phosphorus in natural waters can be subdivided in several ways. One scheme, which stems from conventional measurement techniques and modeling necessity, is (Fig. 28.1)

- Soluble reactive phosphorus (SRP). Also called orthophosphate or soluble inorganic P, this is the form that is readily available to plants. It consists of the species $H_2PO_4^-$, HPO_4^{2-} , and PO_4^{3-} .
- Particulate organic P. This form mainly consists of living plants, animals, and bacteria as well as organic detritus.
- Nonparticulate organic P. These are dissolved or colloidal organic compounds containing phosphorus. Their primary origin is the decomposition of particulate organic P.
- Particulate inorganic P. This category consists of phosphate minerals (e.g., apatite phosphorus), sorbed orthophosphate (e.g., on clays), and phosphate complexed with solid matter (e.g., calcium carbonate precipitates or iron hydroxides).
- *Nonparticulate inorganic*. This group includes condensed phosphates such as those found in detergents.

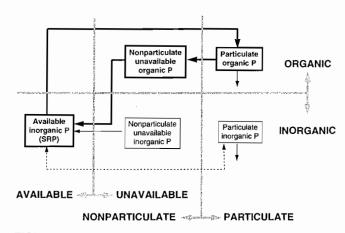

FIGURE 28.1

Forms of phosphorus found in natural waters. The principal forms involved in the production/decomposition life cycle are shown in bold.

Exhibit 7

Phosphorus, P(mg) Content of Selected Foods per Common Measure, sorted alphabetically

| NDB_No | Description | Weight (g) | Common Measure | Content per Measure |
|--------|--|------------|----------------|------------------------|
| 14006 | Alcoholic beverage, beer, light | 354 | 12 fl oz | 42 |
| 14003 | Alcoholic beverage, beer, regular, all | 355 | 12 fl oz | 50 |
| 14010 | Alcoholic beverage, daiquiri, prepared-from-recipe | 60 | 2 fl oz | 3 |
| 14037 | Alcoholic beverage, distilled, all (gin, rum, vodka, whiskey) 80 proof | 42 | 1.5 fl oz | 2 |
| 14550 | Alcoholic beverage, distilled, all (gin, rum, vodka, whiskey) 86 proof | 42 | 1.5 fl oz | 2 |
| 14551 | Alcoholic beverage, distilled, all (gin, rum, vodka, whiskey) 90 proof | 42 | 1.5 fl oz | 2 |
| 14414 | Alcoholic beverage, liqueur, coffee, 53 proof | 52 | 1.5 fl oz | 3 |
| 14017 | Alcoholic beverage, pina colada, prepared-from-recipe | 141 | 4.5 fl oz | 10 |
| 14536 | Alcoholic beverage, wine, dessert, dry | 103 | 3.5 fl oz | 9 |
| 14057 | Alcoholic beverage, wine, dessert, sweet | 103 | 3.5 fl oz | 9 |
| 14096 | Alcoholic beverage, wine, table, red | 103 | 3.5 fl oz | 24 |
| 14106 | Alcoholic beverage, wine, table, white | 103 | 3.5 fl oz | 19 |
| 11001 | Alfalfa seeds, sprouted, raw | 33 | 1 cup | 23 |
| 09016 | Apple juice, canned or bottled, unsweetened, without added ascorbic acid | 248 | 1 cup | 17 |
| 09011 | Apples, dried, sulfured, uncooked | 32 | 5 rings | 12 |
| 09003 | Apples, raw, with skin | 138 | 1 apple | 15 |
| 09004 | Apples, raw, without skin | 110 | 1 cup | 12 |
| 09020 | Applesauce, canned, sweetened, without salt (includes USDA commodity) | 255 | 1 cup | 15 |
| 09019 | Applesauce, canned, unsweetened, without added ascorbic acid (includes USDA commodity) | 244 | 1 cup | 12 |
| 09403 | Apricot nectar, canned, with added ascorbic acid | 251 | 1 cup | 23 |
| 09027 | Apricots, canned, heavy syrup pack, with skin, solids and liquids | 258 | 1 cup | 31 |
| 09024 | Apricots, canned, juice pack, with skin, solids and liquids | 244 | 1 cup | 49 |
| 09032 | Apricots, dried, sulfured, uncooked | 35 | 10 halves | 25 |
| 09021 | Apricots, raw | 35 | 1 apricot | 8 |
| 11008 | Artichokes, (globe or french), cooked, boiled, drained, without salt | 168 | 1 cup | 123 |
| 11008 | Artichokes, (globe or french), cooked, boiled, drained, without salt | 120 | 1 medium | 88 |
| 11015 | Asparagus, canned, drained solids | 72 | 4 spears | 31 |
| 11012 | Asparagus, cooked, boiled, drained | 60 | 4 spears | 32 |
| 11019 | Asparagus, frozen, cooked, boiled, drained, without salt | 60 | 4 spears | 29 |
| 11019 | Asparagus, frozen, cooked, boiled, drained, without salt | 180 | 1 cup | 88 |
| 09038 | Avocados, raw, California | 28.35 | l oz | 15 |
| 09039 | Avocados, raw, Florida | 28.35 | 1 oz | 11 |
| 18005 | Bagels, cinnamon-raisin | 71 | 3-1/2" bagel | 71 |
| 18005 | Bagels, cinnamon-raisin | 89 | 4" bagel | 89 |
| 18003 | Bagels, egg | 71 | 3-1/2" bagel | 60 |
| 18003 | Bagels, egg | 89 | 4" bagel | 75 |
| 18001 | Bagels, plain, enriched, with calcium propionate (includes onion, poppy, sesame) | 71 | 3-1/2" bagel | 62 |
| 18001 | Bagels, plain, enriched, with calcium propionate (includes onion, poppy, sesame) | 89 | 4" bagel | 77 |
| 19077 | Baking chocolate, unsweetened, liquid | 28.35 | 1 oz | 96 |
| 19078 | Baking chocolate, unsweetened, squares | 28.35 | 1 square | 113 |
| 11028 | Bamboo shoots, canned, drained solids | 131 | 1 cup | 33 |
| 09040 | Bananas, raw | 150 | 1 cup | 33 |
| 09040 | Bananas, raw | 118 | 1 banana | 26 |
| 20006 | Barley, pearled, cooked | 157 | 1 cup | 85 |
| 20005 | Barley, pearled, raw | 200 | 1 cup | 442 |

| NDB_No | Description | Weight (g) | Common Measure | Content per Measure |
|--------|---|------------|----------------|------------------------|
| 16006 | Beans, baked, canned, plain or vegetarian | 254 | 1 cup | 188 |
| 16008 | Beans, baked, canned, with franks | 259 | 1 cup | 269 |
| 16010 | Beans, baked, canned, with pork and sweet sauce | 253 | 1 cup | 258 |
| 16011 | Beans, baked, canned, with pork and tomato sauce | 253 | 1 cup | 293 |
| 16015 | Beans, black, mature seeds, cooked, boiled, without salt | 172 | 1 cup | 241 |
| 16025 | Beans, great northern, mature seeds, cooked, boiled, without salt | 177 | 1 cup | 292 |
| 16034 | Beans, kidney, red, mature seeds, canned | 256 | 1 cup | 233 |
| 16033 | Beans, kidney, red, mature seeds, cooked, boiled, without salt | 177 | 1 cup | 251 |
| 16038 | Beans, navy, mature seeds, cooked, boiled, without salt | 182 | 1 cup | 262 |
| 16043 | Beans, pinto, mature seeds, cooked, boiled, without salt | 171 | 1 cup | 251 |
| 11056 | Beans, snap, green, canned, regular pack, drained solids | 135 | 1 cup | 27 |
| 11053 | Beans, snap, green, cooked, boiled, drained, without salt | 125 | 1 cup | 36 |
| 11061 | Beans, snap, green, frozen, cooked, boiled, drained without salt | 135 | 1 cup | 39 |
| 11932 | Beans, snap, yellow, canned, regular pack, drained solids | 135 | 1 cup | 26 |
| 11724 | Beans, snap, yellow, cooked, boiled, drained, without salt | 125 | 1 cup | 49 |
| 11732 | Beans, snap, yellow, frozen, cooked, boiled, drained, without salt | 135 | 1 cup | 42 |
| 16051 | Beans, white, mature seeds, canned | 262 | 1 cup | 238 |
| 22402 | Beef Macaroni, frozen entree | 240 | 1 package | 134 |
| 22905 | Beef stew, canned entree | 232 | 1 cup | 128 |
| 13818 | Beef, chuck, blade roast, separable lean and fat, trimmed to 1/8" fat, choice, cooked, braised | 85 | 3 oz | 168 |
| 13348 | Beef, cured, corned beef, canned | 85.05 | 3 oz | 94 |
| 13350 | Beef, cured, dried | 28.35 | 1 oz | 51 |
| 23578 | Beef, ground, 75% lean meat / 25% fat, patty, cooked, broiled | 85 | 3 oz | 161 |
| 23573 | Beef, ground, 80% lean meat / 20% fat, patty, cooked, broiled | 85 | 3 oz | 165 |
| 23568 | Beef, ground, 85% lean meat / 15% fat, patty, cooked, broiled | 85 | 3 oz | 168 |
| 13869 | Beef, round, bottom round, separable lean and fat, trimmed to 1/8" fat, all grades, cooked, braised | 85 | 3 oz | 173 |
| 23605 | Beef, round, bottom round, separable lean only,trimmed to 1/8" fat, all grades, cooked, braised | 85 | 3 oz | 184 |
| 13878 | Beef, round, eye of round, separable lean and fat, trimmed to 1/8" fat, all grades, cooked, roasted | 85 | 3 oz | 148 |
| 23598 | Beef, round, eye of round, separable lean only, trimmed to 1/8" fat, all grades, cooked, roasted | 85 | 3 oz | 158 |
| 13930 | Beef, top sirloin, separable lean and fat, trimmed to 1/8" fat, all grades, cooked, broiled | 85 | 3 oz | 178 |
| 23610 | Beef, top sirloin, separable lean only, trimmed to 1/8" fat, all grades, cooked, broiled | 85 | 3 oz | 198 |
| 13327 | Beef, variety meats and by-products, liver, cooked, pan-fried | 85 | 3 oz | 412 |
| 11087 | Beet greens, cooked, boiled, drained, without salt | 144 | 1 cup | 59 |
| 11084 | Beets, canned, drained solids | 170 | 1 cup | 29 |
| 11084 | Beets, canned, drained solids | 24 | 1 beet | 4 |
| 11081 | Beets, cooked, boiled, drained | 170 | 1 cup | 65 |
| 11081 | Beets, cooked, boiled, drained | 50 | 1 beet | 19 |
| 18016 | Biscuits, plain or buttermilk, prepared from recipe | 101 | 4" biscuit | 166 |
| 18016 | Biscuits, plain or buttermilk, prepared from recipe | 60 | 2-1/2" biscuit | 98 |
| 18015 | Biscuits, plain or buttermilk, refrigerated dough, higher fat, baked | 27 | 2-1/2" biscuit | 138 |
| 18013 | Biscuits, plain or buttermilk, refrigerated dough, lower fat, baked | 21 | 2-1/4" biscuit | 98 |
| 09042 | Blackberries, raw | 144 | 1 cup | 32 |
| 09055 | Blueberries, frozen, sweetened | 230 | 1 cup | 16 |
| 09050 | Blueberries, raw | 145 | 1 cup | 17 |

| NDB_No | Description | Weight (g) | Common Measure | Content per Measure |
|--------|---|------------|---------------------|------------------------|
| 07008 | Bologna, beef and pork | 56.7 | 2 slices | 92 |
| 07014 | Braunschweiger (a liver sausage), pork | 56.7 | 2 slices | 95 |
| 18079 | Bread crumbs, dry, grated, plain | 28.35 | 1 oz | 47 |
| 18376 | Bread crumbs, dry, grated, seasoned | 120 | 1 cup | 212 |
